

A binary number is a combination of 1s and 0s. Its n^{th} least significant digit is the n^{th} digit starting from the right starting with 1. Given a decimal number, convert it to binary and determine the value of the 4^{th} least significant digit.

Example

number = 23

- Convert the decimal number 23 to binary number: $23_{10} = 2^4 + 2^1 + 2^1 + 2^0 = (10111)_2$
- The value of the 4^{th} index from the right in the binary representation is 0.

Function Description

Complete the function fourthBit in the editor below.

fourthBit has the following parameter(s):

int number: a decimal integer

Returns:

int: an integer 0 or 1 matching the 4th least significant digit in the binary representation of number.

Constraints

$$0 \leq \text{number} < 2^{31}$$

Input Format for Custom Testing

Input from stdin will be processed as follows and passed to the function.

The only line contains an integer, number.

Sample Case 0

Sample Input 0

STDIN Function

32 → number = 32

Sample Output 0

0

Explanation 0

- Convert the decimal number 32 to binary number: $32_{10} = (10000)_2$
- The value of the 4th index from the right in the binary representation is 0.

Sample Case 1

Sample Input 1

STDIN Function

77 → number = 77

Sample Output 1

1

Explanation 1

- Convert the decimal number 77 to binary number: $77_{10} = (1001101)_2$
- The value of the 4th index from the right in the binary representation is 1.

Answer: (penalty regime: 0 %)

Reset answer

```
1 // Complete the 'fourthBit' function below.
2 //
3 // The function is expected to return an
4 // The function accepts INTEGER number as
5 //
6 //
7
8 int fourthBit(int number)
9 {
10     int binary[32];
11     int i=0;
12     while(number>0)
13     {
14         binary[i]=number%2;
15         number/=2;
16         i++;
17     }
18     if(i<4)
19     {
20         return binary[7];
21     }
22     else
23         return 0;
24 }
```

Test	Expected	Got
✓ printf("%d", fourthBit(32));	0	0
✓ printf("%d", fourthBit(77));	1	1

Passed all tests ✓

Determine the factors of a number (i.e., all positive integer values that evenly divide into a number) and then return the p^{th} element of the list, sorted ascending. If there is no p^{th} element, return 0.

Example

$n = 20$
 $p = 3$

The factors of 20 in ascending order are {1, 2, 4, 5, 10, 20}. Using 1-based indexing, if $p = 3$, then 4 is returned. If $p = 6$, 0 would be returned.

Function Description

Complete the function `getFactor` in the editor below.

`getFactor` has the following parameter(s):

`int n`: the integer whose factors are to be found

`int p`: the index of the factor to be returned

Returns:

`int`: the long integer value of the p^{th} integer factor of n or, if there is no factor at that index, then 0 is returned

Constraints

$1 \leq n \leq 10^{13}$

$1 \leq p \leq 10^3$

Input Format for Custom Testing

Input from stdin will be processed as follows and passed to the function.

The first line contains an integer n , the number to factor.

The second line contains an integer p , the 1-based index of the factor to return.

Sample Case 0

Sample Input 0

STDIN Function

--- ---

10 \rightarrow $n = 10$

2 \rightarrow $p = 2$

Sample Output 0

5

Explanation 0

Factoring $n = 10$ results in {1, 2, 5, 10}. Return the $p = 2^{\text{nd}}$ factor, 5, as the answer.

Sample Case 1

Sample Input 1

STDIN Function

--- ---

10 \rightarrow $n = 10$

5 \rightarrow $p = 5$

Sample Output 1

0

Explanation 1

Factoring $n = 10$ results in {1, 2, 5, 10}. There are only 4 factors and $p = 5$, therefore 0 is returned as the answer.

Sample Case 2

Sample Input 2

STDIN Function

--- ---

1 \rightarrow $n = 1$

1 \rightarrow $p = 1$

Sample Output 2

1

Explanation 2

Factoring $n = 1$ results in {1}. There is 1st factor of 1 is returned as the answer.

Answer: (penalty regime: 0 %)

Result answer

```
1 //  
2 * Complete the 'getFactor' function below.  
3 *  
4 * The function is expected to return a long integer.  
5 * The function accepts following parameters:  
6 * 1. LONG_INTEGER n  
7 * 2. LONG_INTEGER p  
8 *  
9 *  
10 long getFactor(long n, long p)  
11 {  
12     int count = 0;  
13     for(long i=1; i<=n; i++)  
14     {  
15         if(n%i==0)  
16         {  
17             count++;  
18             if(count==p)  
19             {  
20                 return i;  
21             }  
22         }  
23     }  
24 }
```

Sample Output 0

5

Explanation 0

Factoring $n = 10$ results in $(1, 2, 5, 10)$. Return the $p = 3^{\text{rd}}$ factor, 5, as the answer.

Sample Case 1

Sample Input 1

STDIN Function

10 \rightarrow $n = 10$

5 \rightarrow $p = 5$

Sample Output 1

0

Explanation 1

Factoring $n = 10$ results in $(1, 2, 5, 10)$. There are only 4 factors and $p = 5$, therefore 0 is returned as the answer.

Sample Case 2

Sample Input 2

STDIN Function

1 \rightarrow $n = 1$

1 \rightarrow $p = 1$

Sample Output 2

1

Explanation 2

Factoring $n = 1$ results in (1) . The $p = 1^{\text{st}}$ factor of 1 is returned as the answer.

Answer: (penalty regime: 0 %)
